Energy expenditure on pulmonary ventilation can be measured with universal pneumotachograph. Under normal conditions with ventilation of 5-10 liter/min, the respiratory energy expenditure is small (approx. 0.4 kg-m/min). As ventilation increases, the amount of work involved also increases and at a quicker pace than the ventilation itself. This fact puts a limit to (Biological Sciences--Pathology, TT, v. 10, no. 12) (over)
